

Evaluating the 10-year risk of recurrent cardiovascular events and potential effects of secondary prophylaxis in people with HIV

Rosa H. Elias, MD
PhD Candidate Infectious Diseases

University Medical Centre Utrecht,
the Netherlands

*The 17th Netherlands Conference on HIV Pathogenesis, Epidemiology, Prevention and Treatment
November 26th 2024*

UMC Utrecht

Disclosure of speaker's interest

(Potential) conflict of interest	None
----------------------------------	------

Rationale

- PWH have a higher risk of recurrent cardiovascular events¹
- Main drivers are largely unknown
- Insight in recurrence risk and interventions
- Role of HIV-treating health care providers
- SMART2 tool²
 - 10-year recurrence risk
 - potential treatment effects

Objectives

- Assess the 10-year risk of recurrent atherosclerotic cardiovascular events in PWH
- Estimate the potential risk reduction

And how this relates to the general population

Methods (1)

Population

- ATHENA cohort¹
 - In follow-up between 2018 – 2021
 - Age 40 – 80 years
 - Established atherosclerotic cardiovascular disease (ASCVD)

1:1 matched for non-modifiable SMART2 parameters*

* Age, sex, type of ASCVD, years since first event

- UCC-SMART cohort²
 - Single centre with ~9000 participants with history of ASCVD
 - Collection of demographical, clinical and biochemical data
 - Yearly follow-up for the occurrence of new events

Methods (2)

SMART2 algorithm

1. 10-year risk of recurrent cardiovascular event
 - Hazard model with cardiovascular predictors *
 - Extensive external (international) validation¹

* Gender, age, smoking status, years since first cardiovascular event, type of ASCVD, diabetes mellitus, systolic blood pressure, hs-CRP, eGFR, non-HDL-c, and use of antithrombotics

2. Estimate potential treatment effects
 - LDL-c reduction to $< 1.4 \text{ mmol/L}^2$ ³
 - Treating systolic blood pressure when $> 140 \text{ mmHg}$ ⁴
 - Smoking cessation ⁵
 - Antithrombotics ⁶

Baseline characteristics (1)

	ATHENA cohort (HIV+)	UCC-SMART cohort (HIV-)	p-value
Matching criteria	N = 1,247	N = 1,247	
Age	62.4 (8.9)	62.5 (9.1)	0.670
Sex assigned at birth			0.444
Male	1,115 (89%)	1,103 (88%)	
Female	132 (11%)	144 (12%)	
Years since first cardiovascular event	7.3 (6.0)	7.5 (8.7)	0.487
Coronary artery disease	849 (68%)	843 (68%)	0.797
Cerebrovascular disease	457 (37%)	507 (41%)	0.040

Mean (SD) and median [Q1,Q3] accordingly.

Participants are generally well suppressed and have good immunological response

Baseline characteristics (2)

	ATHENA cohort (HIV+) N = 1,247	UCC-SMART cohort (HIV-) N = 1,247	p-value
--	-----------------------------------	--------------------------------------	---------

Cardiovascular and metabolic parameters

Current smoker	503 (40%)	237 (19%)	
Former smoker	410 (33%)	676 (54%)	
Systolic blood pressure (mmHg)	134 (19)	137 (19)	<0.001
Low-density lipoprotein (mmol/L)	2.30 (0.90)	2.50 (0.95)	<0.001

Antiretroviral therapy

Abacavir	132 (11%)	NA	
Protease inhibitor	257 (21%)		

Mean (SD) and median [Q1,Q3] accordingly.

Baseline characteristics (2)

	ATHENA cohort (HIV+) N = 1,247	UCC-SMART cohort (HIV-) N = 1,247	p-value
Cardiovascular and metabolic parameters			
Current smoker	503 (40%)	237 (19%)	
Former smoker	410 (33%)	676 (54%)	
Systolic blood pressure (mmHg)	134 (19)	137 (19)	<0.001
Low-density lipoprotein (mmol/L)	2.30 (0.90)	2.50 (0.95)	<0.001
Antiretroviral therapy		NA	
Abacavir	132 (11%)		
Protease inhibitor	257 (21%)		

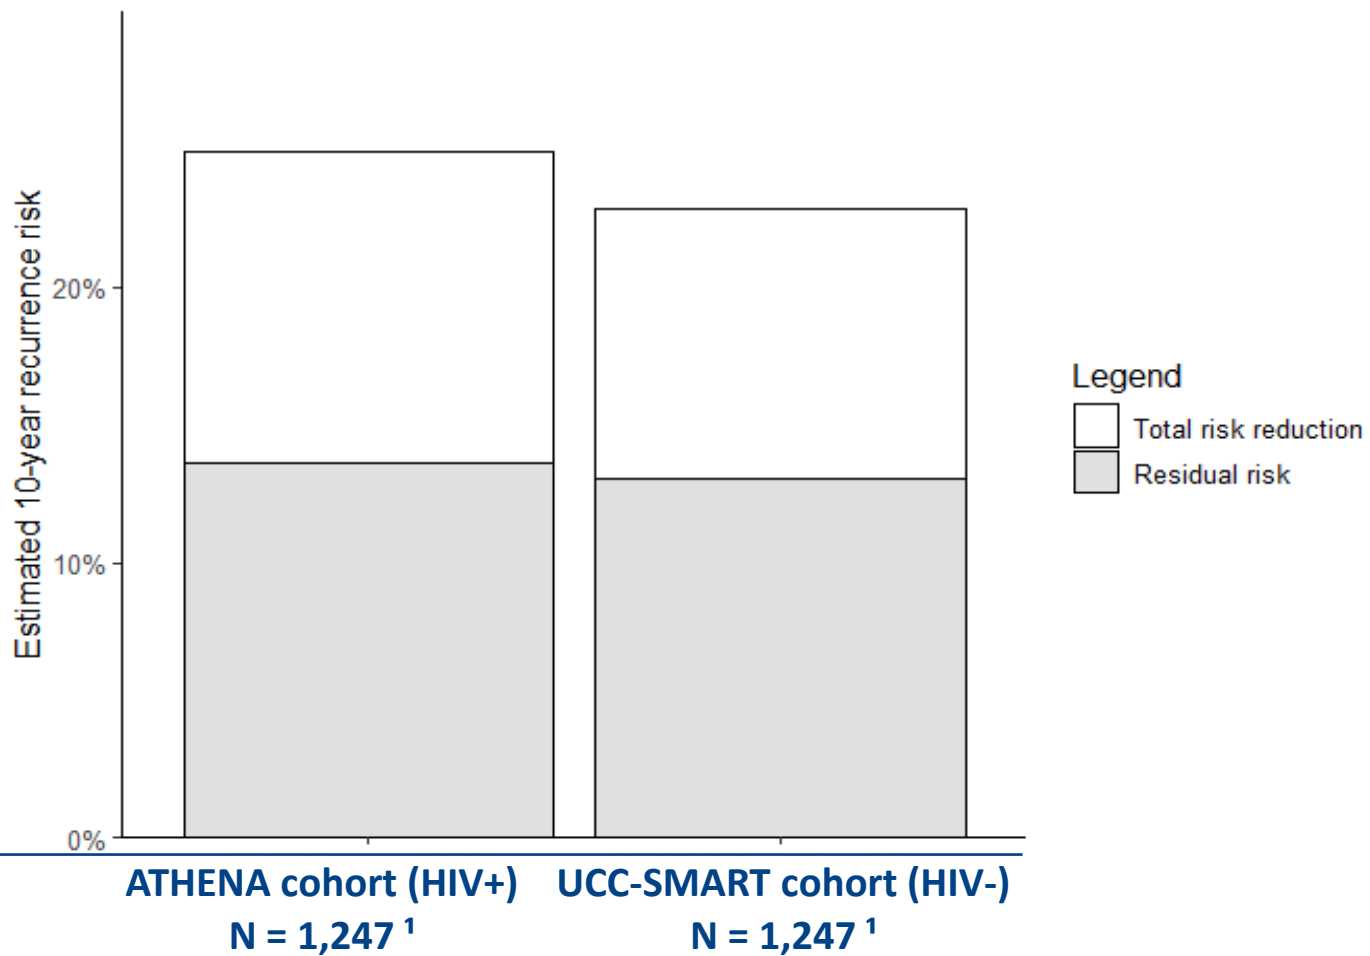

Mean (SD) and median [Q1,Q3] accordingly.

Baseline characteristics (3)

	ATHENA cohort (HIV+) N = 1,247	UCC-SMART cohort (HIV-) N = 1,247	p-value
Estimated 10-year risk	25% (12)	23% (12)	<0.001
Risk category			<0.001
<10%	37 (3.0%)	101 (8.1%)	
10-20%	479 (38%)	513 (41%)	
20-30%	396 (32%)	357 (29%)	
≥30%	335 (27%)	276 (22%)	

Mean (SD) and median [Q1,Q3] accordingly.

Results

People with HIV

Combined intervention

- *Total group (N = 1,247)* 113 events per 1000 PY averted
- *≥ 30 % risk group (N = 335)* 207 events per 1000 PY averted

Individual interventions

- *Smoking cessation (N = 503)* 87 events per 1000 PY averted
- *LDL-c reduction (N = 1096)* 52 events per 1000 PY averted

Discussion

10-year recurrence risk of 25% versus 23%

- Main drivers in PWH: smoking and LDL-c
- Similar treatment effects in both groups
 - Smoking cessation major impact

Considerations

SMART2 not primarily validated for HIV population but:

- Insight in traditional risk factors and interventions
- Possibly underestimating statin effect ¹

- Follow-up: validating in prospective cohort

Effect of weight reduction?

Highlight

- Currently: 10-year risk of 25%
- Aim: 45% relative risk reduction
 - Effective individual interventions
- Identifying high-risk individuals is key
 - Still a lot to achieve
